72 Tests
Complete

***Note about values outside range**

The 3 tests that fell outside any range were the first iteration of tests for their respective part. Each part passed all other subsequent tests.
I believe the reason the system may have failed is that the tube connected to the pump being tested was not fully accompanied into the pump's output.
It's also possible the tube coming out of the sensor, and back into the water container, was blocked by the wellbottom of the container.
The 3 tests that failed were all relatively early on in testing, and I resolved these operator-error issues in later tests, not encountering them again.

***1st Iterations has lower readings**

The first iteration of testing on many of the parts seemed to have a lower reading than subsequent readings frequently.
I believe this may be due to the tube not being fully connected to the pump. I frequently secured the tube further after the first iteration.
